(- classification) - [- Regretion) K Nearest Neighbors (KNN)

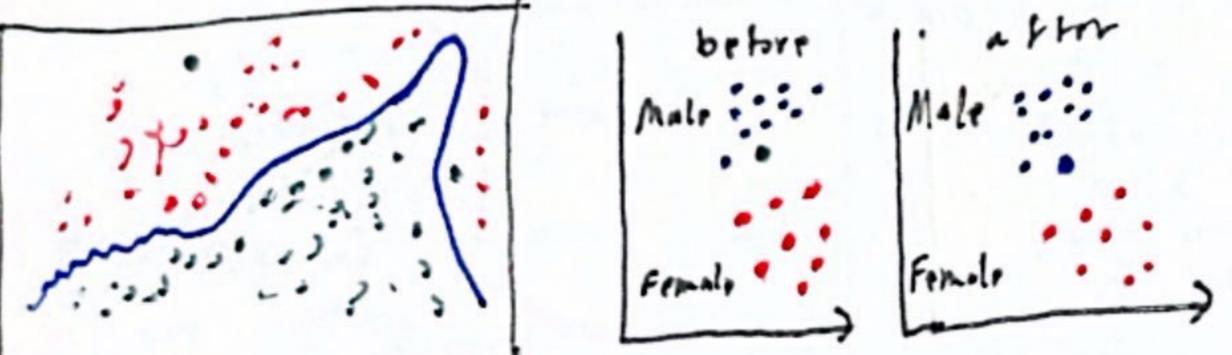

- KNN is a simple NON-parametric algorithm used for Clasification & Regretion. This means that we don't try to fit any equations and thus find any parameters of a model so no trut model fifting is needed.

2 A Per idea of KNN is for any given new lata point (input) he will embich the forget (only of) to be the argor majority of its

K hearest neighbors. K is a hyper paramete like Ke gar K=4...
